

EVOLVE D11 DEACTIVATOR

Intelligent Deactivation

If EAS tags are not properly deactivated, it causes disruption and embarrassment to honest shoppers when they exit a store.

The EVOLVE D11 deactivator is a fundamental component of an EVOLVE system. Capable of recognizing multiple tag types, EVOLVE D11 offers fast and accurate deactivation, and sounds an alert if a tag has not been successfully deactivated.

- Distinguishes between deactivatable and reusable tags
- 'Time-stamps' every deactivation to provide accurate compliance reporting
- Provides excellent deactivation performance
- Increases speed of throughput at point of sale
- Creates a positive shopping experience by reducing unwanted alarms

EVOLVE D11 **DEACTIVATOR**

EVOLVE D11 deactivator pad, chassis and remote key switch

- Minimizes the risk of error during deactivation
- Delivers real-time retail intelligence
- Highlights areas susceptible to internal fraud
- Reinforces staff confidence in EAS by reducing unwanted alarms
- Connects seamlessly with other components of the EVOLVE network
- Enables remote maintenance and software upgrades
- Compatible with multiple barcode scanners including models from NCR, Symbol/Motorola, PSC/Datalogic, IBM and Metrologic.

The EVOLVE D11 deactivator recognizes, time-stamps and reports on the number of security-tagged items that are processed at the point of sale, differentiating between hard and soft tags. This source of retail intelligence can be used to monitor sales and source tagging programs, and highlight cases of internal fraud.

One EVOLVE D11 chassis is capable of driving two pads or two scanners or a combination of both, without reducing the strength or height of the deactivation field. These two drive channels are independent and do not require an interface box. The system also offers the option of an interlock mode to prevent sweet-hearting. The deactivator will only deactivate a tag or label when the EPOS simultaneously scans a product SKU. It will not allow deactivation without a scanned product.
